Transmission and Reception Electromagnetic waves facilitate wireless communication by transmitting signals from a source (transmitter) to a receiver. The process involves modulating a carrier wave with information (voice, data, video) and then radiating it through space. Key stages include:

- Modulation: Embedding information onto the wave by varying amplitude (AM), frequency (FM), or phase (PM).
- Propagation: The wave traverses the medium—free space or guided structures like waveguides.
- Reception: The receiver captures the wave, demodulates it to extract the original information.

Frequency Spectrum and Allocation Different communication services operate within specific frequency bands, each suited to particular applications:

- Radio frequencies (RF): Used for AM/FM radio, television, and mobile phones.
